Pumping Lemma

Theorem

Let the infinite regular language L, there exist a constant m (i.e. pumping length) such that for every string $\omega \in L$ of length $|\omega| \ge m$, a string ω may be split into 3 substring x, y and z;

$$\omega = x y z$$

such that

1
$$y \neq \varepsilon$$
 or $|y| \ge 1$
2 $|xy| \le m$
2 The string $xy^{i}z \in I$: where $i = 0$

3 The string $xy^i z \in L$; where $i = 0, 1, \ldots$

then the language is regular.

Pumping lemma is always for negative test.

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

Example: The language $L = \{a^n b^n : n \ge 0\}$ is not regular. **Proof:** Using Pumping Lemma Assume for contradiction that $L = \{a^n b^n : n \ge 0\}$ is a regular language Since L is infinite, so we can apply Pumping Lemma Let m be the integer in Pumping Lemma, and a string ω such that $\omega \in L$ so $|\omega| \ge m$ pick

$$\omega = a^{m}b^{m}$$
$$a^{m}b^{m} = x y z$$

it must be that : length $|xy| \le m$ and $|y| \ge 1$

$$a^m b^m = \widehat{\hat{a}} \check{A} \acute{c}$$

E Sac

- 1. If a language L is finite then, L is regular language. **Example 1.:** $L_1 = \left\{ a^n b^n : n \le 10^{10^{10^{10}}} \right\}$ **Solution :** n is bounded so this is finite language and then the language is regular.
- 2. If a language L is infinite and we can construct finite automata(either DFA or NFA or ε -NFA) of language then, L is regular language.

Example 2.: $L_2 = \{a^n : n \ge 1\}$ **Solution :** $L_2 = \{a, aa, aaa, ...\}$

3. Finite Automata don't have memory to save infinite length string so it don't have capacity to matching and counting the string, so that language is non regular.

Example 2.: $L_3 = \{a^n b^n \mid n \geq 1\}$

Solution : n is unbounded so the language is infinite. Infinite counting is not done by finite automata. Finite automata can have finite memory.So that language is non regular.

Example 3.: $L_4 = \left\{ \omega \omega^R : \omega \in \Sigma^* \right\}$

Solution : This is infinite language. Read entire ω and save it in the memory and compare whenever ω^R and the length of ω is infinite. We know that finite automata doesn't have the capacity to save infinite length string therefore this language is not regular language. **Example 4.:** $L_5 = \{\omega\omega : \omega \in \Sigma^*\}$ **Solution :** Using above explanation this language is does not regular language.

4. Let Σ = {a}. If the string length is in A.P., so that language is regular language otherwise non-regular language.
Example 5. L₁ = {aⁿ | n is even number.}
Solution : So the language

$$L_1 = \left\{ a^0, a^2, a^4, \ldots \right\}$$

= { length 0, 2, 4, ...}

String length is in A.P. and common difference represent in loop in finite automta so the language is regular.

Example 6. $L_2 = \{a^n \mid n \text{ is prime number.}\}$ **Solution :** So the language String length is not in A.P. and common difference not represent in loop in finite automta so the language is non-regular.

< □ > < 同 > < 回 > < 回 > < 回 >

5. Based on dependency.

Let $\Sigma = \{a, b\}$.

The reason for non-regularity is not just either infinite counting or infinite comparison or infinite memory.

Some time even the pattern may not be able to put on a finite automata therefore these language is not regular.

Example 7.
$$L_1 = \left\{ a^i b^{j^2} : i, j \ge 1. \right\}$$

Solution : string of a and b is independent and a^i is in A.P. and b^{j^2} is not in A.P. so the language is non-regular.

Example 8.
$$L_2 = \left\{ a^i b^{2^n} : i, n \ge 1. \right\}$$

Solution : String of a and b is independent and a^i is in A.P. and b^{2^n} is not in A.P. so the language is non-regular.

6. We know that finite automata is not capable of doing unbounded counting but it is capable of doing modular counting.
Example 9. L₁ = {ω : n_a(ω) = n_b(ω) and ω ∈ Σ}
Solution : The question contain either = or ≥ or ≤ .The language is unbounded counting because of word can be have any length. So the language is non-regular.

Example 10.

 $L_2 = \{\omega : n_a(\omega) \mod 3 \ge n_b(\omega) \mod 3 \text{ and } \omega \in \Sigma\}$ Solution : The question contain either $= \text{ or } \ge \text{ or } \le$. The language is modular counting. So the language is regular.
