Value of Timing diagram

Theoretical ~~di~~ V.T.D of otto cycle - 4 S

In actual cycle practice it is difficult to open and close the valve instantaneously. So as to get better performance of engine the valve timings are modified.

before

$\text{IVO} \rightarrow 10^\circ - 20^\circ \text{ TDC}$ ,  $\text{IVC} \rightarrow 30^\circ - 40^\circ \text{ after BDC}$

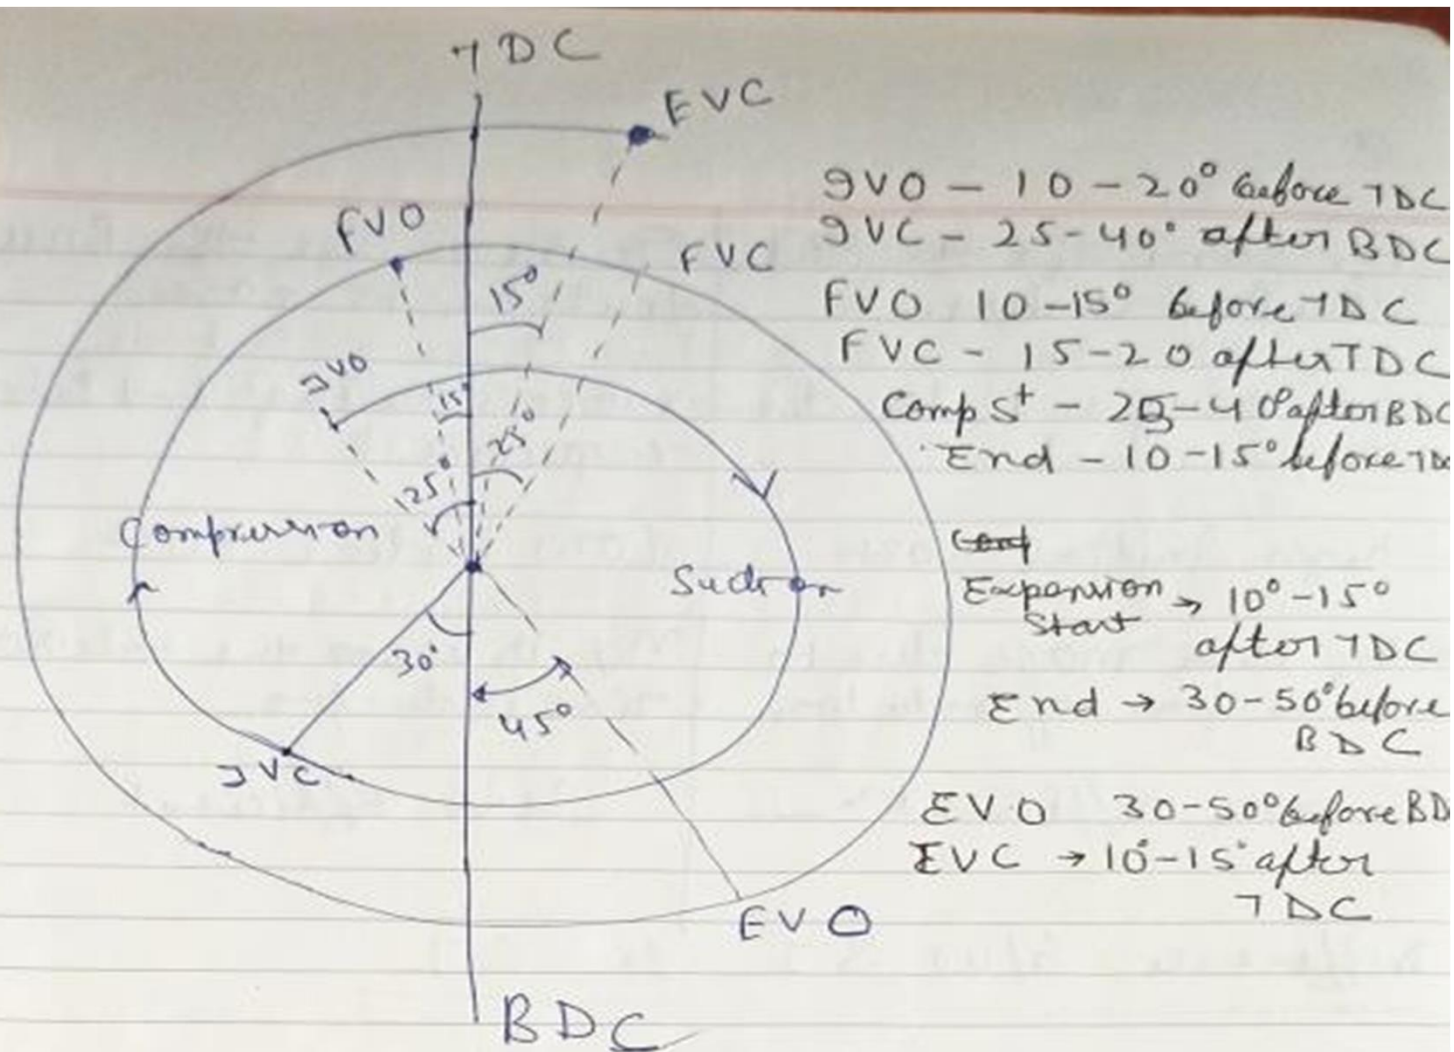

Compression Start - at  $30^\circ - 40^\circ \text{ after BDC}$ ,

Compression End -  $20 - 30$  before TDC

Ignition take place -  $20 - 30^\circ$  before TDC

Expansion Start  $20 - 30^\circ$  before TDC

Expansion End at  $30 - 50^\circ$  before BDC

Actual value timing diagram of 4S, Diesel cycle.

## Difference b/w 2 Stroke and four stroke Engine

4-S	2-S
<p>The cycle is completed in four strokes of piston or two revolution of shaft.</p>	<p>the cycle is completed in two stroke of piston or one revolution of crank.</p>
<p>because of four stroke the turning moment is not uniform and hence the larger fly wheel is used.</p>	<p>as turning moment is uniform smaller fly wheel is used.</p>
<p>it has valves</p>	<p>it has ports.</p>

12

For same size the Power develop is less.

less cooling and lubrication requirements

high initial cost

\*  $\eta_v$  is more due to more time of induction

more Efficient

For same size the Power develop is more.

more cooling and lubrication requirement.

Low initial cost.

$\eta_v$  is less due to less time induction.

less Efficient.

## Difference b/w SI & CI

SI

- (1) It is based on Otto cycle
- 2) Fuel has high self ignition temp
- 3) Carburetor is used for homogeneous Air Fuel ratio in the Engine cylinder
- 4) Ignition occurs with spark plug
- 5) ~~low~~ Compression ratio in range of 6-10
- High speed due to smaller wet.
- Low efficiency due to smaller compression ratio
- Lighter

CI

- It is based on Diesel cycle
- Low self ignition temp
- Fuel is injected with the help of Fuel injector
- Ignition occurs due to high compression
- Compression ratio in the range of 16-20
- Low speed as the Engine are Bulky
- High  $\eta$  due to large compression ratio.
- no wear.
