Unit and Dimensions

TOPICS:

- (1) standard systems of units: CGS, MKS, FPS & SI
- (2) Units of mass, length, energy and temperature.

Unit conversions:

$$1 \text{ lb} = 453 \text{ g}$$

$$1 \text{ kg} = 2.2 \text{ lb}$$

$$1 \text{ in} = 2.54 \text{ cm} = 25.4 \text{ mm}$$

$$1 \text{ ft} = 30 \text{ cm}$$

$$1 \text{ hp} = 746 \text{ Watt}$$

$$1 \text{ cal} = 4.18 \text{ J}$$

$$1 \text{ Btu} = 1055 \text{ J}$$

(lb = pound)

Date: 28/07/23

Temperature units: **Lecture-5**

$$\frac{C}{5} = \frac{F-32}{9} = \frac{K-273.15}{5} = \frac{R-491.7}{9}$$

$$1\Delta^{\circ}C = 1.8\Delta^{\circ}F$$

$$1\Delta K = 1.8\Delta R$$

Absolute temperature scales: start from 0 value.  
eg. Kelvin and Rankine

Relative temperature scales: Celsius and Fahrenheit

Reference points: Constant (thermodynamic) states

Lower fixed point: Freezing point of water:  $0^{\circ}C = 32^{\circ}F = 273.15K = 492^{\circ}R$

Upper fixed point: Boiling point of water:  $100^{\circ}C = 212^{\circ}F = 373.15K = 672^{\circ}R$

# Pressure scales:

Absolute pressure (value above zero pressure)

Relative pressure; with respect to atmospheric pressure

$$\text{gauge pressure } P_g = P_{\text{abs}} - P_{\text{atm}}$$

$$\text{vacuum: } P_{\text{atm}} - P_{\text{abs}}$$

Pressure units:  $\text{N/m}^2$  (pascal Pa), atm, psi,  $\text{kg}_f/\text{cm}^2$ , bar, mmHg

$$1 \text{ atm} = 1.01325 \text{ bar} = 1.01325 \times 10^5 \text{ Pa} = 14.7 \text{ psi}$$
$$= 1.033 \text{ kg}_f/\text{cm}^2 = 760 \text{ mmHg}$$

$$1 \text{ kg}_f = 9.81 \text{ N}$$

$$\text{psi} = \text{pound force}/\text{in}^2$$

Question: convert

$$1 \text{ kg}_f/\text{cm}^2 = ? \text{ Pa}$$

Date: 31/07/23 Lecture - 6

## Conversion of units and equations

Units: To convert one unit to another, just substitute the equivalent values of unit in other system

Ex: 7 Hougan and Watson text:  $k = 16.2 \frac{\text{Btu}^{\text{hr}}}{\text{s ft}} = 0.067 \frac{\text{kcal}}{\text{s m}}$

Equation: To convert an equation containing dimensional constant, substitute equivalent values in desired units: Ex. 8 and Ex. 9 (Hougan & Watson)

An equation must be dimensionally consistent i.e. it must have equal dimensions of units in both side of equality sign '='. For example:  $P = A - \frac{B}{T+C}$  [Antoine eq.]

$P = \text{pressure (Pa)}$ ,  $T = \text{temperature (}^{\circ}\text{C)}$   
 $A = \text{constant (Pa)}$   
 $C = \text{constant (}^{\circ}\text{C)}$   
 $B = \text{constant (Pa}^{\circ}\text{C)}$

Date: 02/08/2023 All Absent: Lecture - nil

Date: 04/08/2023 Lecture: 7

Equations — { Dimensional equations  $\Rightarrow$  have same dimensions of units in both sides of '='  
Dimensionless equation  $\Rightarrow$  have no net dimension. If any constant exists it is also  
unitless and independent of units used.

Example:  $Nu = 0.023 Re^{0.8} Pr^{0.33}$

We  $Nu =$  Nusselt no.  $= \frac{hD}{k}$  where  $h =$  heat transfer coeff.  
 $D =$  length,  $k =$  thermal conductivity

$Re =$  Reynold's no.  $= \frac{Dv\rho}{\mu}$  where  $D =$  diameter,  $v =$  velocity,  
 $\rho =$  density,  $\mu =$  viscosity

$Pr =$  Prandtl no.  $= \frac{c_p \mu}{k}$  where  $c_p =$  heat capacity,  $\mu =$  viscosity  
 $k =$  thermal conductivity

**Problem:** Given rate expression as  $r_A = 0.005 C_A^2$ , where  $r_A = \frac{\text{mol}}{\text{cm}^3 \cdot \text{min}}$ ,  $C_A = \frac{\text{mol}}{\text{m}^3}$   
Find rate expression if  $r_A = \frac{\text{mol}}{\text{L} \cdot \text{hr}}$  and  $C_A = \frac{\text{mol}}{\text{L}}$

# Problems and Solutions: Conversion of Unit and Equations

(1) (A) Convert heat capacity expression  $c_p = a + bT$  into  $c'_p = a' + b'T'$  where

$$c_p = \frac{\text{cal}}{(\text{mol})(\text{K})}, T = \text{K}, c'_p = \frac{\text{Jule}}{(\text{mol})(\text{C}^\circ)}, T' = \text{C}^\circ$$

Solution:-

$$c_p \frac{\text{cal}}{(\text{mol})(\text{K})} = c'_p \frac{\text{Jule}}{(\text{mol})(\text{C}^\circ)} = c'_p \frac{(1/4.18) \text{cal}}{(\text{mol})(\text{K})} = \frac{0.239 c'_p \text{cal}}{(\text{mol})(\text{K})}$$

$$\text{therefore } c'_p = \frac{c_p}{0.239} = 4.18 c_p$$

$$T \text{ K} = T' \text{C}^\circ = T' \text{K},$$

$$\text{therefore } T = T'$$

Substituting  $c_p$  and  $T$  in terms of  $c'_p$  and  $T'$  in given eq.  $c_p = a + bT$

$$0.239 c'_p = a + bT'$$

$$\text{on } c'_p = \frac{a}{0.239} + \frac{b}{0.239} T' = 4.18a + 4.18bT' = a' + b'T'$$

where  $a' = 4.18a$  and  $b' = 4.18b$

$$\text{Thus } \underline{c'_p = 4.18(a + bT')} \text{ Answer}$$

1(B) What are the units of  $a$  and  $b$ ?

Solution :- Since quantities with same units can be added OR subtracted

$$\begin{aligned} \text{unit of } a &= \text{unit of } bT = \text{unit of } (a+bT) \\ &= \text{unit of } C_p = \frac{\text{cal}}{(\text{mol})(\text{K})} \\ \text{unit of } b &= \frac{\text{unit of } C_p}{\text{unit of } T} = \frac{\text{cal}}{(\text{mol})(\text{K}^2)} \end{aligned}$$
