

# NOOTROPICS

# CONTENTS

- Introduction
- Classification
- Screening Methods
- In vivo
- In vitro
- Application

# NOOTROPICS

- Nootropic is a compound that increases mental functions including  
Memory
- Motivation
- Concentration
- Attention

# How do Nootropics work

- Increase in Brain metabolism
- Increased Cerebral circulation
- Protection of brain from Chemical damage

# CLASSIFICATION

## 1. Cholinergic activator

- Rivastigmine
- Donepezil
- Galantamine

## 2. Glutamate antagonist

- Memantine

## 3. Miscellaneous

- Piracetam
- Pyritinol

# Screening Methods

- ❖ In Vitro
  - Inhibition of acetyl cholinesterase activity in rat striatum
- ❖ In Vivo
  - Avoidance learning
    - Passive Avoidance
    - Active Avoidance

# In vivo

## Avoidance Learning

### Active Avoidance:

- Active performance of a certain response prevent the dislike stimulus.

### Passive Avoidance

- Withholding a response prevents the dislike outcome.

## Passive Avoidance

- The testing apparatus is a trough-shaped alley divided into two distinct compartments that are separated by a sliding door.
- The white, brightly lit compartment is free of aversive stimulation whereas the black, dark compartment is equipped with shock capability.
- The training trial begins by placing the animal in the white compartment facing the door.
- The door is opened to allow access to the dark compartment.
- The latency to enter the dark compartment is recorded.

- When the animal steps into the dark compartment with all four paws, the door is closed and a 1-2 second foot shock is delivered
- The animal remains in the dark compartment for an additional 10 seconds after the termination Of the aversive stimulus before being removed and placed back into its home cage.
- The apparatus is cleaned with 70% ethanol in between animals,

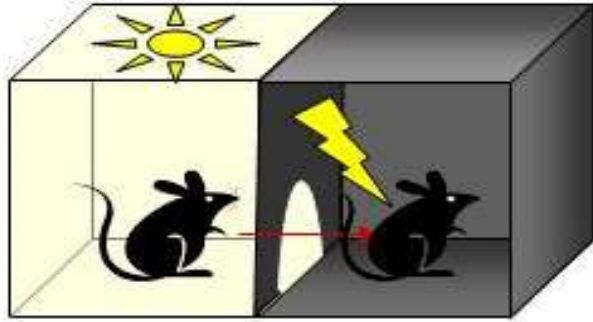

# Test Trial

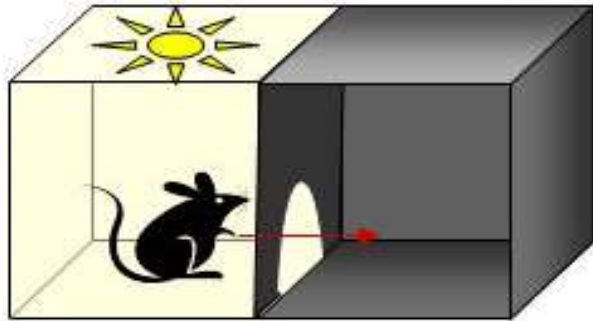

- At the time of the test trial (usually 1-7 days after training), the animal is again placed inside the white compartment and the door is raised to allow access TEST to the dark compartment.
- The latency to re-enter the dark compartment is recorded; however, there is noaversive stimulus applied to animal upon re-entry into the dark compartment during testing.

## Step-Through Passive Avoidance

**Train**

**Test:**  
*measure time to step through*

## Step-Down Passive Avoidance

**Train**

**Test:**  
*measure time to step down*

# Active Avoidance

- In this task, animals are placed in a two-compartment shuttle box and have to learn the association between a conditioned stimulus (CS, e.g. light)
- Conditioned response/Avoidance Subjects give a conditioned response when they avoid receiving the shock, by moving to the opposite compartment during the CS presentation (avoidance response).
- Unconditioned response/Fescape If animals do not act, footshock is delivered, but can be escaped by moving to the opposite compartment (escape response).
- This escape deficit can be prevented by administering nootropics.

# Active Avoidance Paradigm

Shuttle Box  
Active Avoidance

*Train*

*Test:*

*Can the animal avoid the shock?*

# Evaluation

- The time the animal need to reach the safe area on both days is measured.
- An addition numbers of errors are recorded.( not reaching the safe area).

# APPLICATIONS

- Nootropics used in Ayurvedic traditional medicine to Improve memory.
- Eg- Brahmi
- Nootropics is purported to treat or prevent the following health problems:
  - Alzheimer's disease
  - Anxiety
  - Central nervous system disorders (such as epilepsy)
